DENON

SERVICE MANUAL

FULLY AUTOMATIC DIRECT DRIVE TURNTABLE SYSTEM

MODEL DP-11F SERIES

U.S. and Canadian models do not include cartridge.

NIPPON COLUMBIA CO., LTD.

WARNING:

1. Component parts

Parts marked with \triangle and/or shading in this service manual have special characteristics important to safety. Be sure to use the specified parts for replacement.

2. Leakage current

Before returning the appliance to customer, test the leakage current when the power plug is connected. Use a calibrated (with an error of not more than 5%) leakage current tester and measure the leakage current from any exposed metal to the earth ground. Reverse the power plug polarity and test the above again.

Any current measured MUST NOT EXCEED 0.5 miliamps. Corrective measure must be taken if it exceeds the limit.

FEATURES

Silent, fully automatic operations with the use of a microprocessor controlled contactless servo tonearm.

An innovative microprocessor controlled, contactless servo tonearm ensures safe, easy to use automatic operations with little loss in sound quality.

Low mass straight arm

This arm is fully capable of maximizing the performance of high compliance cartridges with outstanding tracing ability. Even with the newest, high grade records, its tracing ability is outstanding.

DENON Quartz

The turntable speed is controlled by the "DENON Quartz" which is the combination of the "High Precision Magnetic Pulse Detection Method", the most sophisticated method of FG detection, and the "Quartz Lock".

SPECIFICATIONS

Phonomotor section

Drive system: Servo controlled direct drive

Turntable speeds: 33-1/3, 45 rpm

Wow & flutter: Below 0.02% wrms (servo system)

Below 0.03% wrms (JIS)

S/N ratio: Over 75 dB (DIN-B)

Rise time: Normal speed within 2 seconds (at 33-1/3 rpm)

Platter: Aluminum die-cast; 300 mm diameter

Motor: Linear drive motor

Speed control system: Speed servo by frequency detection, phase servo control

Speed deviation: Below 0.002%

Load characteristics: 0% (80 g stylus force; outermost groove)

General

Power supply: 50~60 Hz, Voltage is shown on rating label

Power consumption: 7 W

Dimensions: 100 x 365 x 335 mm (H x W x D)

Weight: Approximately 5 kg

Tonearm section

Arm type: Dynamically balance, semi-integrated straight arm

Effective length: 220 mm
Overhang: 16 mm

Tracking error: Within 3°

Automatic mechanism: Electronically controlled, fully automatic

Adjustable stylus force range: $0\sim3.0 \text{ g (1 scale}=0.1 \text{ g)}$

Suitable cartridge weight range: Approximately 4.0~6.0 g (including screws, nuts)

Cartridge section (Only for those models with attached cartridge)

DL-60

Type: Moving magnet (MM)

Output voltage: 2.5 mV
Frequency response: 20~30 kHz

Stylus force: 1.8±0.3 g

Above specifications and outward appearance may be altered in future for improvement.

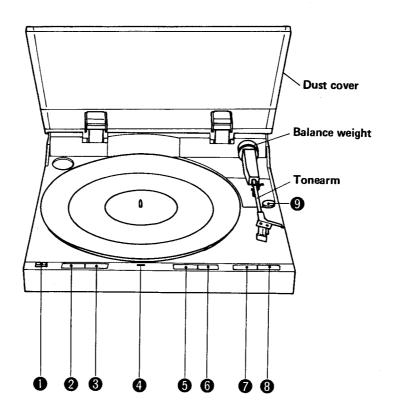

U.S. and Canadian models do not include cartridge.

Note: indicates an analog switch.

PART NAMES AND FUNCTION

(1) POWER (Power switch)

This switch turns the power supply on (__) and off (__). When turning the power off, always return the tonearm to the arm rest and hold it in place with the clamp.

(2) SIZE (Record size selector switch)

Set to the size of record to be played.

3 SPEED (Speed selector switch)

Set to the desired record speed.

(4) LOCK (Lock indicator)

When the power is turned on, the lamp will light up. During play, the lamp will flicker until the proper turntable speed is reached. Once the proper speed is obtained, the lamp will, again, stay lit.

(5) REPEAT (Repeat switch)

When playing the records repeatedly, switch it on (lamp lit).

6 ARM LIFTER (Arm lifter switch)

This switch is used to raise and lower the arm during play or when playing the records manually. The lamp is lit when arm is up.

(7) START (Start switch)

Press this switch when starting the records automatically.

8 STOP (Stop switch)

Press this switch when stopping the record during play.

(9) STYLUS FORCE (Stylus force adjustment knob)

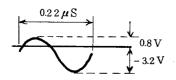

This knob is used to adjust the stylus force.

EXPLANATION OF THE MICROPROCESSOR

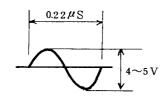

Motor Control IC . . . IR3T02 (at standard revolution of 33 rpm)

The numbers on the left hand side indicates the terminal number.

2. 4.5MHz OSC

3. 4.5MHz OSC

4. rpm selector

H: 45 rpm L: 33 rpm

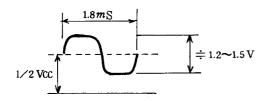

5. power source input

Vcc: 5V ±0.5V

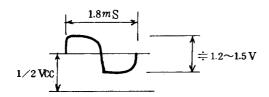

6. FG I bypass terminal

E6 ≒ ½Vcc

7. FG I lowpass terminal

8. FG I output

9. FG I inverse input

The gain set element is connected. E9 ≒ ½Vcc

10. FG I non-inverse input

10mVpp ~ 100mVpp E10 ≒ ½Vcc

14. ground terminal

15. F/V output

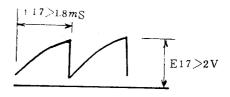

slower than normal revolution: $2 \sim 4.5 \text{V}$ normal revolution: $\frac{1}{2} \text{ 2V}$ faster than normal revolution: $0 \sim 2 \text{V}$

16. F/V hold terminal

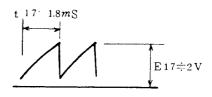

same as terminal 15

17. F/V triangular wave

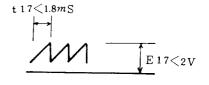

slower than normal revolution

normal revolution

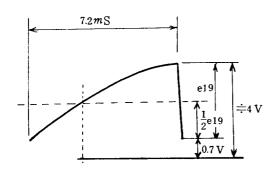

faster than normal revolution

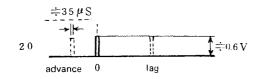

18. timing pulse width-set terminal

E18 = 0.6V

19. PD triangular wave

20. sample pulse monitor terminal

21 PD hold terminal

slow phase: $2 \sim 4V$ normal phase: = 2Vadvanced phase: $1 \sim 3V$

22. PD output

same as terminal 21

23. Lock detector time set terminal

during lock: 0.6V lock disengaged: 0V

25. Revolution detector

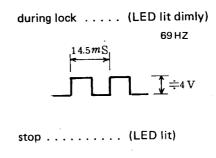

during revolution: __________ ≒ 4V

stop: 0V

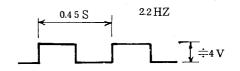

26. START/STOP terminal

H → START L → STOP

28. Lock indicator

during transition . . (LED flashes)

• Arm Control IC IR3T03

The numbers on the left side indicates the terminal number of the IR3T03.

1. Accelaration input

Except for the matching range of the lead-in detector (E7 \leq | \pm 0.6V |), it will recognize the situation and control the acceleration during automatic tonearm operation.

2. Accelaration output

E1 \leq | ± 2.37 V ± 0.1 V | open (will not control the acceleration within the matching range)

 $E1 \ge |\pm 2.3V \pm 0.1V|$ $E2 = \pm 3.95V$

-3.95V: will accelarate toward the inside from rest. +3.95V: will accelarate toward rest from the inside.

3. UP/DOWN selection of the arm lifter

When E9 is H, the control output for lifting the arm will be made at E3 $\stackrel{.}{=}$ -Vcc.

When E9 is L, the control output for lowering the arm will be made at E3 $\stackrel{.}{=}$ +Vcc.

4. Detection of the rest position

 $E4 \le -2.64V$ will be recognized as the arm being at rest.

5. Detection of the END position

When E5 \geq 2.64V, it will be recognized to be within the END detection range.

E5 \geq 2.64V when the stylus tip nears the last sections of the sound groove.

6. End control

Whithin the END detection range of 5 (above), (E5 \geq 2.64V), the arm will be returned by the END control when E6 \geq 0.23V.

E5 \geq 0.23V when the stylus tip moves into the lead-out groove and the arm moves fast.

7. Matching input

E7 \leq | ±0.6V | will be recognized as the match range for lead-in.

8. Drive output

Connect to GND.

9. UP control output

When the lifter is in the UP position during automatic arm operations or when the UP signal is sent by pressing the arm lifter button, pin 9 will be at H level.

E9H = 4V

E9L≒0V

10. DOWN time constant

To ensure that the arm is lowered completely before proceeding to the next movement, a resistor between pins 9 and 10 and a capacitor on pin 10 has a preset discharge time constant which is somewhat longer than the time required for the arm to be lowered. Thus, when pin 9 becomes L (E9L \doteq 0V), and the fixed amount of time elapses, the arm will be recognized to be DOWN as soon as E10 < 2V.

11. ANT (Anti-skating) control

When E10 < 2V, then E11 = -4V will be the control output needed for the anti-skating to be engaged.

When E10 \geq 2V, then E11 $\stackrel{.}{=}$ +4V will be the control output needed for the anti-skating to be disengaged.

12. Negative power source

Supplies -5V.

14. SUB (substratum)

To prevent any interference from the inner elements of the LSI, the substratum terminal is connected to the unregulated side of the negative power source, since it has the lowest electric potential.

15. GND

Standard zero electric potential is the GND.

17. Return control

When the stop command is given, or when the repeat is disengaged and the END is detected (E6 \geq 0.23V), a control signal output (E17H > 4V) is made to return the arm to rest.

E17H > 4V

E17L: release

18. Horizontal drive control

When the arm is in resting position, or when the arm reaches the lead-in position during automatic play, and comes into the matching range (E7 \leq | \pm 0.6V |), a control signal output (E18H \doteq 4V) is made to stop the horizontal motion of the arm.

19. Initial set

This is the preparation time setting terminal when the power source is turned on. The resistor in the LSI and the outer capacitor will set the charge time constant and carry out the initial set.

20. LCTD (Located) time constant

The LSI and its outer circuits will set the LCTD time constant to improve the detection accuracy of the lead-in position and the arm rest position.

E20H = 1.2V A few moments after the arm reaches the range of detection, in other words, after the set LCTD time constant elapses, it will become H level, where it is memorized immediately and then reset to the L level.

E20L = 0V Before and after detection, it will become L level.

21. Turntable (T/T) Drive Control

E21L = 0V the turntable stops E21H release the turntable rotates (refer to the operational explanations for pin 22)

22. Turntable (T/T) Start Position

This terminal establishes the turntable start position. The turntable will start when the arm separates from the arm rest and pin 22 is released, under manual and auto modes.

23. Start

Will start automatically at the GND level.

24. Auto stop

Will stop automatically at the GND level.

25. Lifter

Will raise the lifter automatically at the GND level.

26. Repeat

Will engage the repeat automatically at the GND level.

27. UP SW

An UP time constant circuit is used so that when the lifter is in the UP condition, this terminal is released and becomes H level; and at other times, it becomes GND level. With this unit, the arm will start to move approximately two seconds after the UP command.

28. Positive power supply

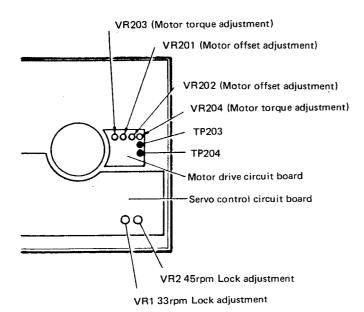

Supplies +5V.

ADJUSTMENT METHOD

* Prepare a two-channel oscilloscope for the measuring instrument,

Adjusting the Phonomotor Section

* Measure, using the wrapping terminal number 8 of the motor drive circuit board as the ground referent point when adjusting the motor OP amp. voltage offset and the motor torque.

1. Adjusting the motor amp. offset voltage

- Fix the tonearm to the arm rest and connect the oscilloscope to TP 203 and 204.
- 2) Rotating the turntable by hand, adjust the center of amplitude at TP 203 to 0 \pm 0.1V by turning VR 201.
- Following the preceding directions adjust to 0 \pm 0.1V by turning VR 202 for TP 204

2. Adjusting the motor torque

- Leave the oscilloscope connections as they were for the motor OP amp. voltage offset adjustments.
- Take the turntable off the main body; move the tonearm close to the speed detection head and rotate the phonomotor at a fast speed.
 - (Note) Be very cautious as not to damage the cartridge during this procedure.
- For T.P. 203, rotate VR 203 and adjust to 15VP-P±0.5V.
- 4) For T.P. 204 , rotate VR 204 and adjust to $15VP-P\pm0.5V$.

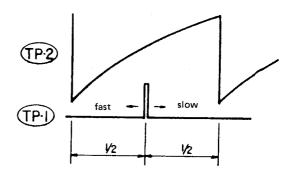

3. Adjusting the head gap

Adjust, so that the gap between the turntable magnetic coating surface and the detection head is 0.18 mm.

4. Lock adjustments for 45 rpm

From hereafter, the earth reference point of the measuring instrument should be connected to T.P. 6 of the servo control circuit board.

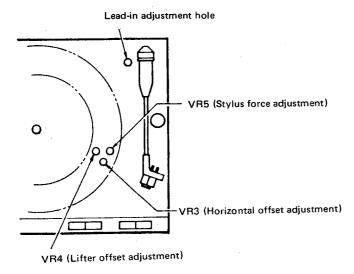

- 1) Connect the two-channel oscilloscope to T.P. 1 and T.P. 2.
- 2) Set the speed selector to 45 rpm.
- Take the arm off the arm rest and move it toward the turntable to rotate the phonomotor.
- 4) Adjust VR2 so that the pulse from T.P. 1 is positioned to ½ the triangular wave length from T.P. 2.

5. Lock adjustments for 33 rpm

- Connect the oscilloscope in the same manner as the 45 rpm lock adjustments. Set the speed selector to 33 rpm.
- 2) Adjust VR1 in the same manner as the lock adjustments for 45 rpm.

Adjusting the Arm Control Section

1. Adjusting the horizontal OP amp. offset voltage

- 1) Fix the tonearm to the armrest and connect the oscilloscope to T.P. 3.
- 2) Set the lifter switch to the UP condition.
- 3) Turn VR3 and adjust to 0V±0.01V.

2. Adjusting the lifter OP amp. offset voltage

- Fix the tonearm to the armrest and connect the oscilloscope to T.P. 4.
- 2) Set the lifter switch to the DOWN condition.
- 3) Turn VR4 and adjust to -1V±0.1V.

3. Adjusting the stylus force

- 1) Turn the power supply switch OFF.
- Take the arm off the armrest. Rotate the balance weight so that the tonearm becomes parallel to the turntable surface when let go.
- Return the arm to the armrest and turn the power supply switch ON.
- 4) Wait five seconds after the arm has lowered. Place the cartridge stylus tip onto a stylus force guage and set the stylus force adjustment knob to 1.5 g.
 - (Note) At this time, the stylus tip height should be adjusted so that it is about the same height as during play.
- Turn VR5 and adjust, so that the stylus force guage reads 1.5 g.

4. Adjusting the 30 cm lead-in position

 Place a 30 cm record on the turntable and set the record size selector switch to "30".
 (Note) Keep the bottom cover closed.

- 2) Move the arm so that the stylus tip is at approximately the 30 cm lead-in position. Insert a small flat-headed screwdriver into the lead-in adjustment hole; move the arm back and forth and fit the screw driver into the groove of the cam inside gently.
- 3) After turning the screwdriver, pull it out. Press the start switch and adjust so that the stylus position stops at the 30 cm lead-in position.

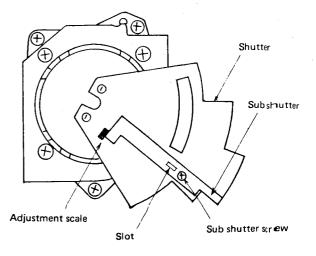

(Note) The 30 cm lead-in adjustments cannot be performed unless the stylus tip position is approximately in the 30 cm lead-in position. In addition, if the screwdriver is left inserted, the arm will not move.

5. Adjusting the 17 cm lead-in position

Adjust as necessary, such as when parts of the sensor section have been replaced.

However, the following procedures should only be used when a discrepancy is found for the 17 cm lead-in position, after the 30 cm lead-in position has been adjusted.

- 1) Set the record size selector to 17 cm.
- 2) By continuously pressing the start switch, the arm will move over and stop. At this time, check now many millimeters, toward the inside or outside, the stylus tip deviates from the required 17 cm lead-in position.
- 3) Take off the bottom cover of the cabinet and check the adjustment scale position of the shutter. (One adjustment scale corresponds to a stylus tip movement of 5 mm.)
- 4) Untighten the screw holding the sub shutter and place a small screwdriver into the slot of the shutter. When the stylus position is toward the inside, compared to the required position, move the sub shutter toward the right of the scale; when the stylus position is toward the outside, move the sub shutter toward the left. When completed, tentatively tighten the screw holding the sub shutter.
- 5) After the adjustments are made, press the start switch and check whether or not the stylus stops at the 17 cm lead-in position.
- If the stylus stops at the required position, then tighten the sub shutter screw.
